TECHNICAL DATA

Range:	0...30V, 0...2A (SN17) 0...60V, 0...1A (SN18)
Remote:	Approx. $0.7\text{k}\Omega/\text{V}$ (SN17) Approx. $1.7\text{k}\Omega/\text{V}$ (SN18)
Regulation at $\pm 10\%$ change of mains voltage,	
Constant voltage:	< $\pm 0.01\%$
Constant current:	< $\pm 0.1\text{mA}$
Regulation at loads 0...100%,	
Constant voltage:	< 0.015%
Constant current:	< $\pm 0.1\text{mA}$
Temp. coefficient, const. voltage:	< $0.002\%/\text{^oC}$
Output impedance:	< $0.002\Omega$ for DC < $0.2\Omega$ at 200kHz
Ripple and noise, 20Hz...200kHz:	< $100\mu\text{V}_{\text{rms}}$ (SN17) < $200\mu\text{V}_{\text{rms}}$ (SN18)
Transient response, loads 30%-100%-30%, nom. voltage $\pm 10\text{mV}$ :	< 50 $\mu\text{sec.}$
Meter,	
Scales:	0...30V, 0...2A and 0...0.6A (SN17) 0...60V, 0...1A and 0...0.3A (SN18)
Accuracy:	$\pm 2\%$ of f.s.d.
Power Supply:	110/220V AC $\pm 10\%$ , 50/60Hz
Consumption:	5...90W
Temperature range:	5...40 $^{\circ}\text{C}$
Dimensions, W x D x H:	163 x 210 x 80mm
Weight:	3.3kg. (7.3 lbs.)
Finish:	Silvery grey and blue enamel
Accessories:	1 manual

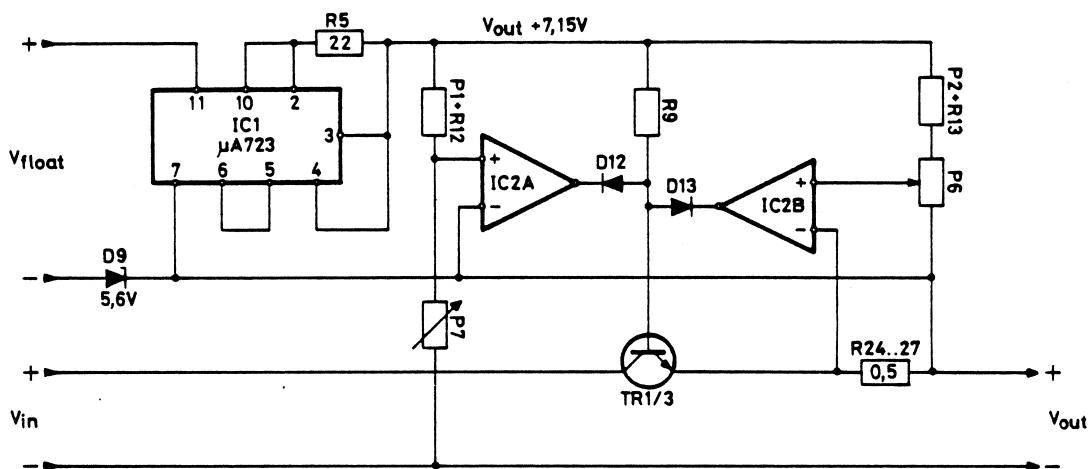

Subject to change without notice

## APPLICATION

With few exceptions the Power Supplies SN17 and SN18 are identical, circuitry-wise. For this reason, the following description will primarily apply to SN17, and SN18 will be mentioned only in cases when it deviates.

The mains transformer is the same for both types. The two primary windings in SN17 are connected in parallel (30V/3.4A), and in SN18 they are connected in series (60V/1.7A). The non-regulated potential is rectified by the bridge circuit, consisting of the diodes D5...D8 and is smoothed by the charging capacitor C11, after which the two series transistors together with the regulating amplifier IC2 provide the remaining smoothing and regulation.

The resistors R19 and R20 have the function to share equally the load current between the two series transistors.

Principle diagram.

Due to the rather high output voltage, and the wish to be able to regulate all the way down to 0V, the regulating circuit has been designed as "floating" with the positive output terminal as reference.

IC1 is coupled as voltage regulator with a voltage limitation of approx. 25mA determined by the resistor R5. The resultant voltage of 7.15V is determined by the temperature stabilized reference voltage in IC1. Consequently, this voltage is very stable and is used as reference voltage for both the voltage comparator IC2A and the current comparator IC2B.

In voltage regulating mode the potential on the non-inverted input will always be the same as on the inverted input. Therefore, the current through P1 and R12 will be determined exclusively by the ratio  $7.15/(P1+R12)$ . Since the same current is passing through the "VOLTAGE" potentiometer P7, the output voltage will be determined by the expression:

$$V_{out} = \frac{7.15}{P1+R12} \times P7$$

When the potential across R24...27 due to increasing load current becomes identical to the potential across the "CURRENT" potentiometer P6 (from the arm to  $+V_{out}$ ) the comparator will assume control of the series transistors TR1 and TR3 (current limitation).

The OR gate, consisting of D12, D13 and R9, will assure, that the regulation will be either for constant voltage or constant current.

The diode D14 and the voltage divider R6/R1, in which R1 is in thermic contact with the heat sink, will assure that the temperature of the latter will never exceed approx. 80°C. At this temperature the voltage across the NTC resistor R1 will have dropped so much that the diode D14 will be conducting. The output of the comparator will go "low", whereby D13 will be conducting and the output voltage will drop. When the temperature in the heat sink for this reason has been reduced, the resistor value in the NTC (R1) will increase, the diode D14 will block, and the function will become normal again.

The LED D15 is powered by the driver transistor TR2, which is "on" in current regulating mode.

With the meter switch in its left-hand position the output voltage is metered with the moving coil instrument (sensitivity 1mA) in series with P5 and R23. The load current is metered with the switch in its centre position, and in the right-hand position the voltage across R24...27 (SN17: 0.5Ω, SN18: 1Ω) is metered. The series resistors in these current ranges are P3/R21 and P4/R22 respectively.

## ADJUSTMENTS

The Power Supplies SN17/SN18 have been designed for long-time operation without adjustments or maintenance. One example, amongst others, of the inherent reliability is that 1% metal film resistors have been used in all critical places in the electric circuit. In normal circumstances, it will only become necessary in case of component failure to check and re-adjust the instrument. In such cases the below procedure should be followed.

To carry out the adjustments described, the following instruments will be needed:

Digital voltmeter, 4½ digit, e.g. Fluke 8050A

Current shunt 0.01Ω, e.g. Bang & Olufsen PC5 (SN17)

Current shunt 1Ω, e.g. Bang & Olufsen PC6 (SN18)

- 1) Check, and adjust, if required, the mechanical zero of the panel meter. (The mains switch (8) in position "OFF").
- 2) Connect the digital voltmeter and turn the "CURRENT" and "VOLTAGE" potentiometers (P6 and P7) fully clockwise, and then adjust P1 to 32.00V ±0.10V (SN18: 65.00V ±0.20V).
- 3) Turn the "VOLTAGE" potentiometer down to 25.00V (SN18: 50.00V) as read on the digital voltmeter, and then adjust P5 to 25V deflection (SN18: 50V) as read on the panel meter ("METER" switch in its left-hand position).
- 4) Set the "METER" switch in its centre position. Load the output with 0.01Ω current shunt, PC5 (SN18: 1Ω, PC6) and connect the digital voltmeter to the latter. Adjust with P2 until 21.00mV ±0.20mV is obtained (SN18: 1.050V ±10mV), corresponding to a load current of 2.1A (SN18: 1.05A).
- 5) Turn the "CURRENT" potentiometer P6 down to 17.00mV ±0.20mV (SN18: 0.800V ±10mV), and then adjust P3 to 1.7A deflection (SN18: 0.8A) on the panel meter.
- 6) Turn the "CURRENT" potentiometer down to 1A deflection (SN18: 0.5A) on the meter, and then tighten the button with the line pointing towards the centre of the LED.
- 7) Turn the "CURRENT" potentiometer down to 5.00mV ±0.05mV (SN18: 0.250V ±3mV). Set the meter switch in its right-hand position, and then adjust P4 to 0.5A deflection (SN18: 0.25A) on the panel meter.

8) After any repair job the instrument shall be insulation tested, when the instrument has been completely assembled and is ready for use.

Short-circuit the two pins on the mains plug and connect to one of the terminals of the insulation tester. Connect the other terminal to the chassis and the black screw terminal respectively.

It is important, in order to avoid instrument damage, that both insulation tester terminals are in really close mechanical contact.

Now increase the output voltage until a voltage of 1.5-2kV AC is achieved. Hold this for about 1 second, then slowly turn the voltage down again.

Flash-overs are not permissible at any point in time during the testing.
